### IN THE CLAIMS:

The following listing of claims will replace all prior versions, and listings, of claims in the application.

 (Original) A method for performing a task using a plurality of applications in a networked computer environment, the method comprising:

sending instructions for performing the task from a first computer system to one or more remote computer systems, wherein the instructions for performing the task comprise instructions for performing one or more subtasks with each of a plurality of applications, and wherein the instructions for performing the task comprise a plurality of messages in a portable format;

translating the instructions for performing the task from the portable format to an executable format at the one or more remote computer systems, thereby generating executable instructions for performing the plurality of subtasks; and

executing the executable instructions to perform the subtasks comprising the task.

## 2. (Original) The method of claim 1,

wherein the instructions are sent to the one or more remote computer systems via a distributed computing infrastructure.

## 3. (Original) The method of claim 1,

wherein the instructions are translated from the portable format to the executable form by a distributed computing infrastructure.

## 4. (Original) The method of claim 1,

wherein the messages are sent from the first computer system to the one or more remote computer systems using unicast peer-to-peer messaging.

#### 5. (Original) The method of claim 1,

wherein the messages are sent from the first computer system to the one or more remote computer systems using multicast peer-to-peer messaging.

### 6. (Original) The method of claim 1,

wherein the messages are sent from the first computer system to the one or more remote computer systems using broadcast peer-to-peer messaging.

### 7. (Original) The method of claim 1,

wherein the portable format comprises XML.

8. (Currently Amended) A earrier computer accessible memory medium comprising program instructions for performing a task using a plurality of applications in a networked computer environment, wherein the program instructions are computer-executable to implement:

sending instructions for performing the task from a first computer system to one or more remote computer systems, wherein the instructions for performing the task comprise instructions for performing one or more subtasks with each of a plurality of applications, and wherein the instructions for performing the task comprise a plurality of messages in a portable format:

translating the instructions for performing the task from the portable format to an executable format at the one or more remote computer systems, thereby generating executable instructions for performing the plurality of subtasks; and

executing the executable instructions to perform the subtasks comprising the task.

# (Currently Amended) The earrier computer accessible memory medium of claim 8, wherein the instructions are sent to the one or more remote computer systems via a distributed computing infrastructure.

10. (Currently Amended) The earrier computer accessible memory medium of claim 8, wherein the instructions are translated from the portable format to the executable form by a distributed computing infrastructure.

- 11. (Currently Amended) The earrier computer accessible memory medium of claim 8, wherein the messages are sent from the first computer system to the one or more remote computer systems using unicast peer-to-peer messaging.
- 12. (Currently Amended) The earrier computer accessible memory medium of claim 8, wherein the messages are sent from the first computer system to the one or more remote computer systems using multicast peer-to-peer messaging.
- 13. (Currently Amended) The earrier computer accessible memory medium of claim 8, wherein the messages are sent from the first computer system to the one or more remote computer systems using broadcast peer-to-peer messaging.
- (Currently Amended) The earrier computer accessible memory medium of claim 8, wherein the portable format comprises XML.
- 15. (Original) A system for performing a task using a plurality of applications in a networked computer environment, the system comprising:
- a first computer system comprising a first CPU and a first memory; and one or more remote computer systems comprising one or more respective remote CPUs and one or more respective remote memories;

wherein the first computer system and the one or more remote computer systems are communicatively coupled via a network;

wherein the first memory stores program instructions which are executable by the first CPU to:

send instructions for performing the task from the first computer system to the one or more remote computer systems, wherein the instructions for performing the task comprise instructions for performing one or more subtasks with each of a plurality of applications, and wherein the instructions for performing the task comprise a plurality of messages in a portable format; wherein the one or more remote memories store program instructions which are executable by the one or more respective remote CPUs to:

translate the instructions for performing the task from the portable format to an executable format at the one or more remote computer systems, thereby generating executable instructions for performing the plurality of subtasks; and

execute the executable instructions to perform the subtasks comprising the task.

### 16. (Original) The system of claim 15,

wherein the instructions are sent to the one or more remote computer systems via a distributed computing infrastructure.

### 17. (Original) The system of claim 15,

wherein the instructions are translated from the portable format to the executable form by a distributed computing infrastructure.

## 18. (Original) The system of claim 15,

wherein the messages are sent from the first computer system to the one or more remote computer systems using unicast peer-to-peer messaging.

# 19. (Original) The system of claim 15,

wherein the messages are sent from the first computer system to the one or more remote computer systems using multicast peer-to-peer messaging.

## 20. (Original) The system of claim 15,

wherein the messages are sent from the first computer system to the one or more remote computer systems using broadcast peer-to-peer messaging.

## 21. (Original) The system of claim 15,

wherein the portable format comprises XML.
